NoWet: The Answer To Water Restrictions

With severe water restrictions and possible fines for allowing soapsuds to enter and pollute waterways, the arrival of NoWet in Australia may solve the car-cleaning problem for the automotive industry in Queensland.

Cleaning vehicles with buckets is messy and time consuming and will never achieve the showroom shine finish. Installing a water recycled car wash is an expensive alternative requiring a constant supply of chemicals (sodium hypochlorite) to kill the bacteria in the water.

On the other hand NoWet is a waterless car-cleaning product free of abrasives, silicones and petroleum distillates such as kerosene. Cars, boats, motorbikes etc can be cleaned; waxed and polished wherever they are parked.

The quality of NoWet was quickly recognised not only by car enthusiasts but also by the Brisbane and Toowoomba City Councils which are currently using it to keep their vehicles clean, shiny & protected from the harsh Australian climate.

NoWet is the only car-cleaning product in Australia awarded the Smart Approved Watermark.

So, what makes NoWet the leader in car-cleaning products and how does it work? One of its outstanding features is the fact that it can be applied to the finish of a dirty vehicle without scratching its surface. Wetting a car with water leaves many small dirt particles on the paintwork which are then rubbed in with the sponge.

"NoWet is a waterless car-cleaning product.."

When micro/misted on the car, Kaolin Clay and other active ingredients in NoWet have the unique ability to encapsulate and emulsify the dirt particles, lifting them off the surface without scratching and preparing them for removal by a simple swipe of a clean terry towel.

The other major ingredient used

Before using NoWet After using NoWet

in NoWet is Carnauba Wax which not only provides a long-lasting shine, but also protects the paint from many contaminants including minor abrasions, UV rays and infra-red light which can oxidise and leave a dull paint finish.

The biggest advantage of the product is that it does not have to be used every week.

After the initial application, the next one can be 30 days later. In between NoWet applications, all you need is a wet (damp) terry towel for cleaning and another dry one for polishing.

NoWet is a win/win situation for the environment and vehicle owners. Its use can save megalitres of water, eliminate pollution of waterways with detergents, and keep the motorised 'pride and joy' clean, buffed, polished and protected.
